- 1. rn flatlist 渲染问题
- 对于除data以外的数据需要添加extraData
- 若data和extraData中都是数组,修改该数据,需要同时修改其引用地址,例如 重新赋值一个新数组

- 2. rn 从A页面路由到B页面,再返回A页面,触发更新方案
- 在A页面添加监听事件,卸载时移除,在B页面goback()之前emit派发该事件

```
componentWillMount() {
  const { navigation } = this.props;
  navigation.setParams({ onPressAddBtn: this.toAddEmployee });
  this.onRefresh();
  // 注册监听事件
  this.listener = DeviceEventEmitter.addListener(DeviceEventName.STAFF_MANAGE, () => this.onRefresh();
  });
}
componentWillUnmount() {
  // 移除通知监听事件(移除之前先判空处理, 增强代码强壮性)
  if (this.listener) {
    this.listener.remove();
}
```

```
Toast.info('添加员工成功', 1.5);
setTimeout(() => {
Toast.hide();

DeviceEventEmitter.emit(DeviceEventName.STAFF_MANAGE);
navigation.goBack();
}, 1500);
```

3. rn 多个text并写,会有样式不对称问题,可以用view隔开处理

4. DeviceEventEmitter

- 5. 设置opacity, 子view会继承,设置如果把就可以避免这个问题
- 6. Image borderTopLeftRadius等属性实现部分圆角会不起作用
- 用imagebackground组件,并在style里面使用圆角和属性overflow: 'hidden'
- 7. debounce(防抖)和throttle(节流)用来控制某个函数在一定时间内执行多少次的 技巧,输入框触发函数常见

8. 子 view撑不开

9. 出现过好几次白屏问题了,如果data 为空,这个View下面就是{},android 会白屏的

10. connect绑定的子组件,父组件引用该子组件,使用ref调子组件的函数会报找不到,需要给connect添加{ withRef: true}

```
TopMenu.propTypes = propTypes;

const mapDispatchToProps = dispatch => ({
    currentActions: bindActionCreators(currentCreators, dispatch),
    dispatch
});

export default connect(null, mapDispatchToProps, [], { withRef: true })(TopMenu);

132
```

```
onShowTopMenu() {
    this.topMenu.toShowHideModal();
}

/**
```

11. 使用flatlist,或者sectionlist的时候,经常会遇到视图不更新的情况,

12. 给view加阴影时使用shadow,会黄色警告,需要增加backgroundColor解决

```
in AppContainer (at renderApplication.js:34)

$\Delta \times \text{(ADVICE) View #22057 of type RCTView has a shadow set but cannot calculate shadow efficiently. Consider setting a background color to fix this, or apply the shadow to a more specific component.

$\Delta \times \text{(ADVICE) View #22045 of type RCTView has a shadow set but cannot calculate shadow efficiently. Consider setting a background color to fix this, or apply the shadow to a more specific component.

$\Delta \times \times \text{(ADVICE) View #22024 of type RCTView has a shadow set but cannot calculate shadow efficiently. Consider setting a background color to fix this, or apply the shadow to a more specific component.
```

```
74 ⊟
       shadow: {
         shadewOffset: { width: 0, height: 0 },
75
         shadowColor: '#000',
76
77
         shadowOpacity: 0.3,
         backgroundColor: '#fff',
78
         flexDirection: 'row',
79
         alignitems: 'center',
80
         shadowRadius: 30,
81
         borderRadius: getRealSize(74),
82
         borderBottomWidth: StyleSheet.hairlineWidth,
83
         borderColor: '#f2f3f4',
84
85
```

13. flatlist 下拉刷新触发多次上拉加载方法,并且上拉加载也会触发多次,解决方案: 定义一个变量限制上拉加载方法请求多次,并且添加onEndReachedThreshold 和 onMomentumScrollBegin 属性

```
<flatList

data={this.props.notificationList}
    renderItem={this.getItem}
    refreshing={this.state.isLoading}
    onRefresh={() => this.onRefresh()}
    keyExtractor={this.getItemKey}
    onEndReached={() => this.onEndReached()}
    onMomentumScrollBegin={() => {
        this.onEndReachedCalled = false;
    }}
    onEndReachedThreshold={0.2}

</SafeAreaContainer>
);
```

```
async onEndReached() {
   const { user, notificationActions, notificationList } = this.props;
   if (this.onEndReachedCalled) {
      return;
   }
   const lastId = notificationList.length ? last(notificationList)._id : 0; // eslint-disable try {
      const result = await notificationActions.getAndUpdateNotificationList({
            platform: Platform.OS,
            to: user.userLoginId,
            beginId: lastId
            }, true);
      if (result.errorCode > 0) { Toast.info(result.message, 1.5); }
      this.onEndReachedCalled = true;
    } catch (e) {
        handleHttpError(e);
    }
}
```

```
You, 11 minutes ago | 7 authors (Kai_Lin and others)
class NotificationScreen extends PureComponent {
   constructor(props) {
      super(props);
      this.onEndReachedCalled = false;
      this.state = {
        isLoading: false
      };
      this.getItem = this.getItem.bind(this);
      this.getItemKey = this.getItemKey.bind(this);
      this.onRefresh = this.onRefresh.bind(this);
      this.getNotifications = this.getNotifications.bind(this);
      this.onEndReached = this.onEndReached.bind(this);
}
```

14. Text显示数字加粗后最后一位无法显示问题,即设置过fontWeight属性的 Text,在OPPO等机型确实有问题

解决办法: 给Text加个fontFamily样式: fontFamily: 'System'

15.Text显示金额的时候字体加粗后显示不全的问题,即设置过fontWeight属性的 Text,在OPPO等机型确实有问题

解决办法: 给Text加个fontFamily样式: fontFamily: 'System' 或者 fontFamily: "
